

SERVICE
MANUAL

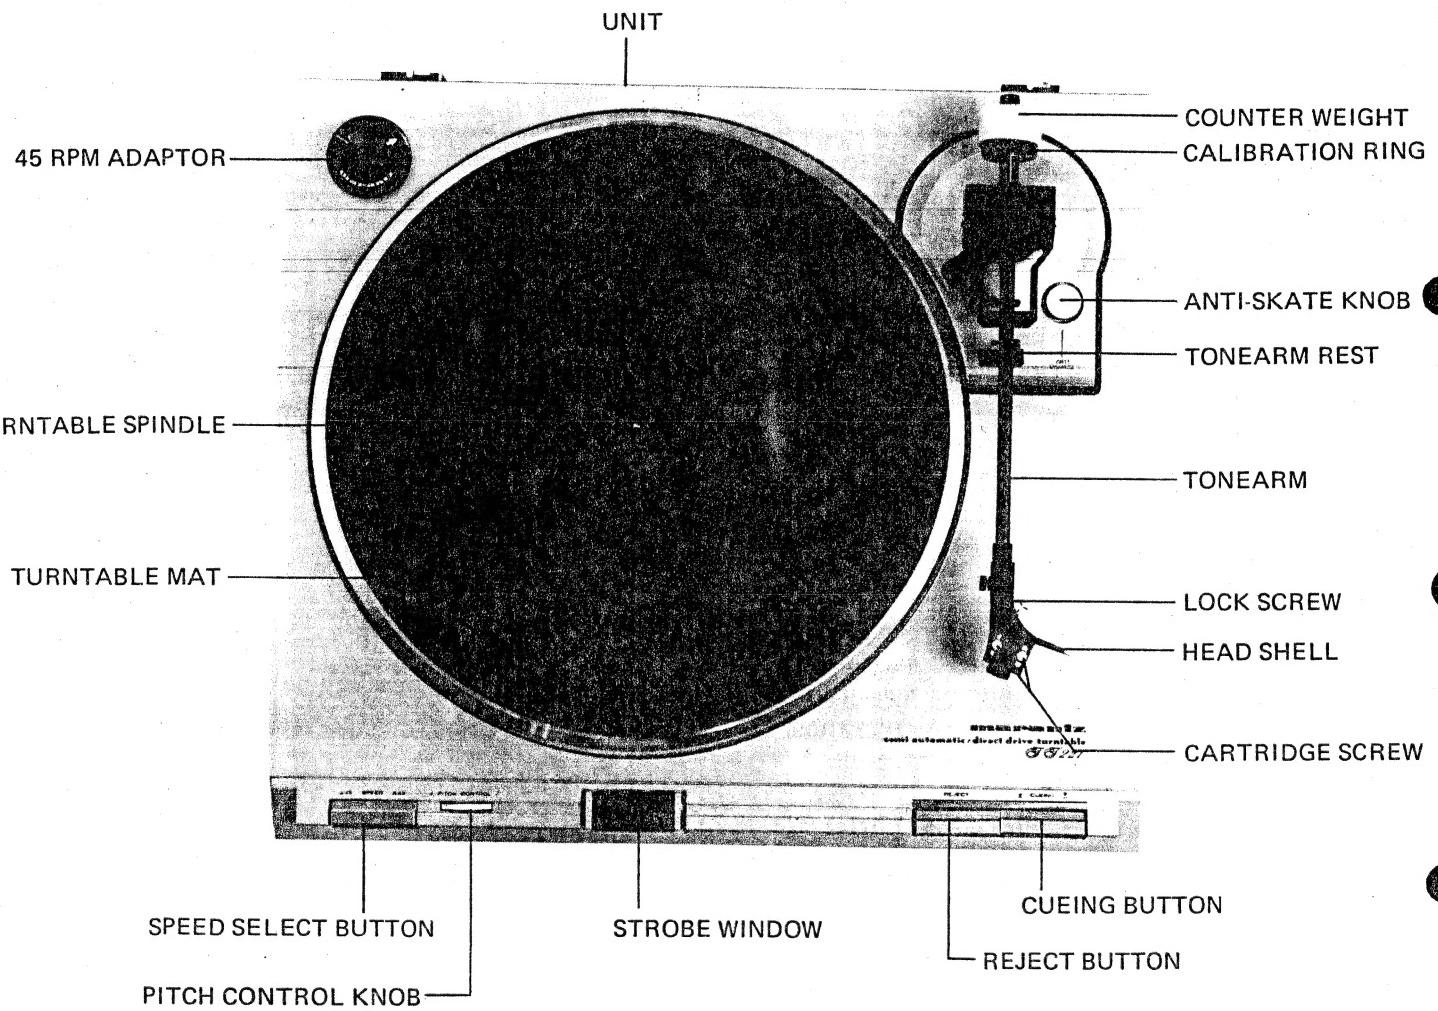

ST 221

m a r a n t z

Model ST 221

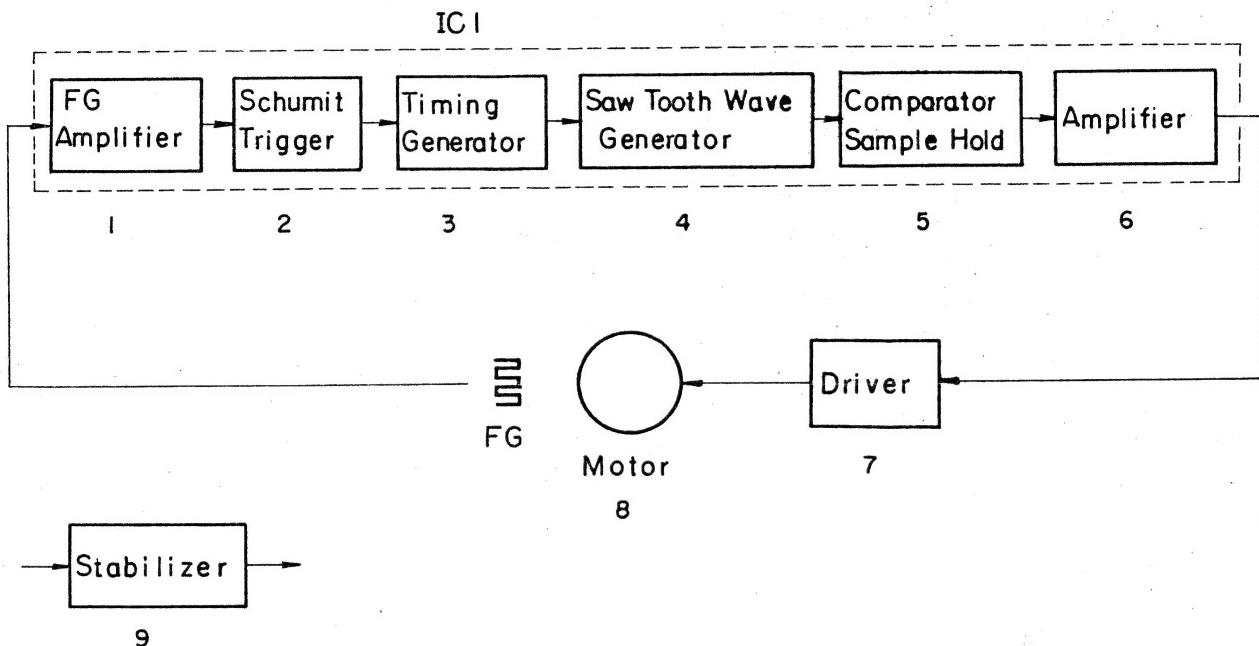

Turntable

DESIGNATION OF PARTS

PRINCIPLE OF OPERATION FOR MOTOR

1. BLOCK DIAGRAM

1) FG Amplifier

FG generator is consist of a rotor which is dually magnetized 8-pole and 160-pole, and all round integrated type FG pattern.

And it generates sine wave of 44.44 Hz at 33-1/3 rpm and 60.00 Hz at 45 rpm. The signals from FG are amplified up to level of threshold voltage of schumit trigger.

2) Schumit Trigger

To convert sine wave from FG amplifier to square wave.

3) Timing Generator

To divide square wave from schmit trigger and generate timing pulse by means of bottom portion of its wave form for RESET, SET and SAMPLE of saw tooth wave.

4) Saw Tooth Wave Generator

To convert timing pulse to saw tooth wave by means of charge and discharge of capacitor or resistor.

5) Comparator, Sample Holder

To sample voltage of saw tooth wave by timing pulse and hold the voltage level, and also compare reference voltage and holded voltage by means of differential circuit.

6) Amplifier(DC)

To amplify output voltage of comparator.

7) Driver

To detect location of polarity magnetized on rotor by means of hole element and select the order of current to feed to 4-pole driving coil.

The voltage applied to coil is controlled by the servo circuit stipulated in the above item No. 1) - 2), which controls rotor speed.

8) Motor

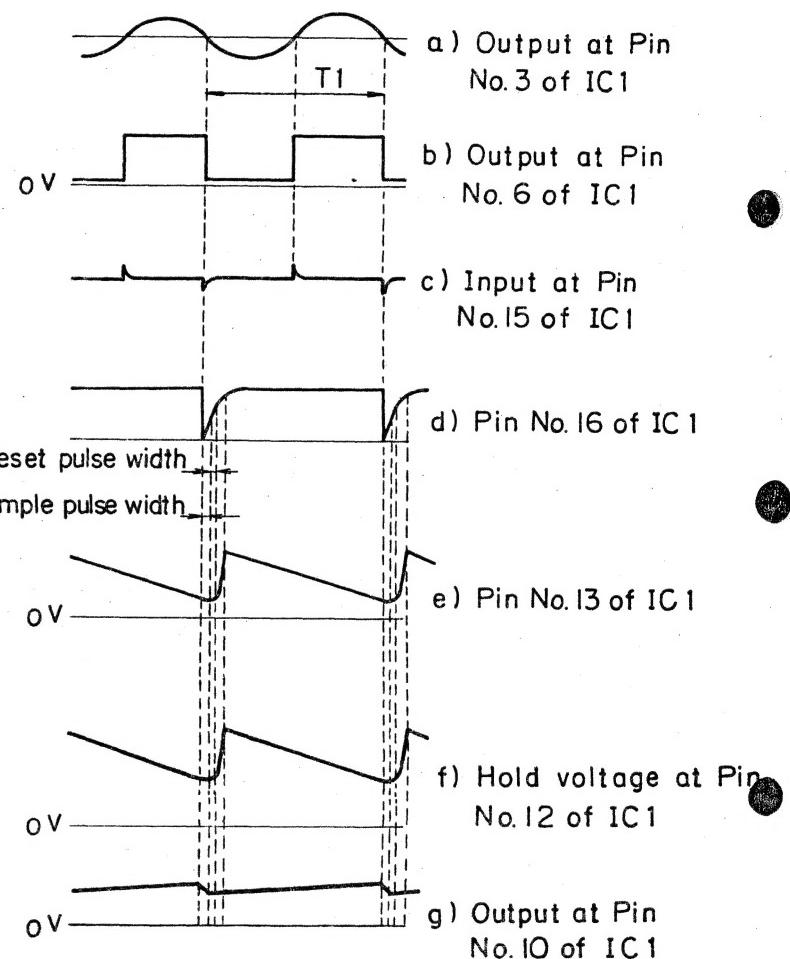

Coreless, slotless and flat type motor with 4-phase, half wave driving system.

9) Stabilizer

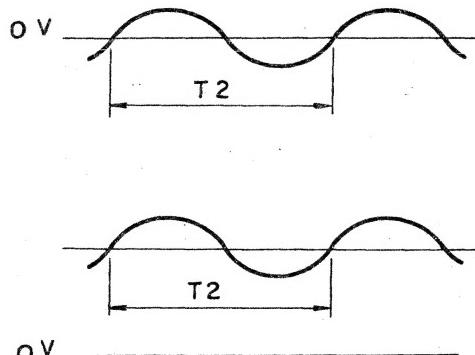

To stabilize inside voltage of IC.

2. TIMING CHART

2-1. Control Section

2-2. Driving Section

1) Output Voltage of hole element between pin No. 7 and No. 9, or between No. 10 and No. 12.

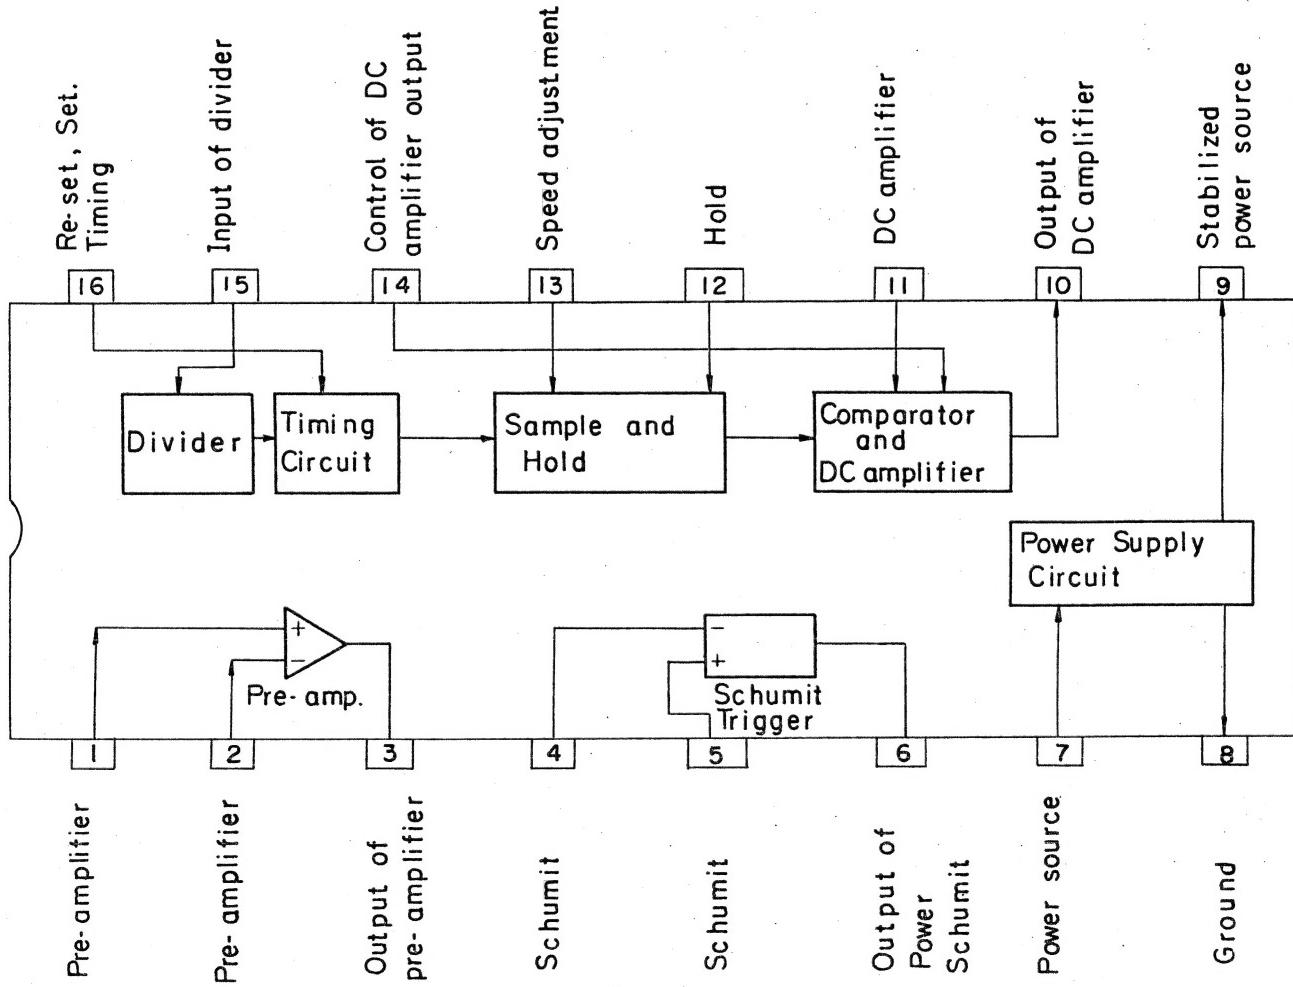

2) Voltage between collector of X9 (X10, X11, X12) and ground.

3. ALIGNMENT METHOD

3-1. Speed alignment

- 1) Set changeover switch to 45 rpm.
- 2) Set potentiometer(pitch control) to its center.
- 3) Set speed to 45 rpm by means of adjusting VR1(100 K ohm).
- 4) Set speed changeover switch to 33-1/3 rpm.
- 5) Set speed to 33-1/3 rpm by means of adjusting VR2(100 K ohm).

4. BLOCK DIAGRAM OF IC1 (JPC1043)

5. ALIGNMENT-ADJUSTMENTS

This service manual was prepared for qualified technicians familiar with Turntable maintenance and alignment procedure. Review complete adjustment sections before proceeding.

Cartridge Wire Color Code

Before installing a cartridge to the headshell, the wires should be connected to the cartridge. The cartridge or its technical sheet will identify the connection pins. It may be necessary to slightly compress the terminal clips on the headshell wires with your fingers to firm the contact area to the pins. Below is the headshell color-description.

Headshell Wires:

Right Channel Hot	Red
Right Channel Ground	Green
Left Channel Hot	White
Left Channel Ground.....	Blue

After wire connections are made, install cartridge mounting screws, provided with the cartridge, through the mounting slots and tighten firmly enough to hold the cartridge in place. Final adjustments are made after the overhang dimension is adjusted.

A Stylus overhang adjustment

A 45 RPM adaptor is supplied with the TT221 turntable that will be used for adjusting the overhang dimension. An arrow is marked on the 45 RPM ADAPTOR, and a gradient scale from 11 through 18.

1. Place the adaptor on the spindle with the arrow pointing towards the rear of the turntable. Gradient scale will be in the lower half quadrant when viewed from the front.
2. Remove stylus protective cover and balance the tone arm. Place the tone arm to the gradient scale and set stylus contact to gradient 15 mm on the 45 RPM ADAPTOR. Set the cartridge screws after checking that the cartridge is parallel to the sides of the headshell.

B. Stylus tracking force adjustment

1. Remove stylus protective cover. Adjust the counterweight until tone arm is capable of being suspended in midair without movement.
2. Set the counterweight dial to zero.
3. Rotate the counterweight towards the pivot point to the manufacturers specified cartridge tracking force.
4. Adjust the anti-skate control to the same force as the stylus tracking force.

C. Pitch-verification

1. Verify that the platter pitch control can be adjusted nominally from $\pm 3.5\%$ in both 45 and 33.3 RPM Modes.
2. Monitor that pitch control stabilizes Dot Patterns on the Platter. If adjustment is necessary, proceed to trouble shooting chart pitch adjustments.

D. Auto-return adjustment

If the Tone Arm returns before the end of the record program or delays to lift at end of record program, the sending arm can be adjusted as follows.

REFER TO FIGURE (1)

1. To slightly delay tone arm return, adjust the fine adjustment screw clockwise.
2. To slightly advance tone arm return, adjust the fine adjustment screw counterclockwise.
3. When larger deviations are necessary, return fine adjustment screw to the middle of its travel.
4. Loosen the feed arm securing screws and adjust the tolerance between the actuating arm and feed-arm assy to 7 mm (.276 in.).
5. Fine adjust tone arm return by repeating steps one or two, where applicable.

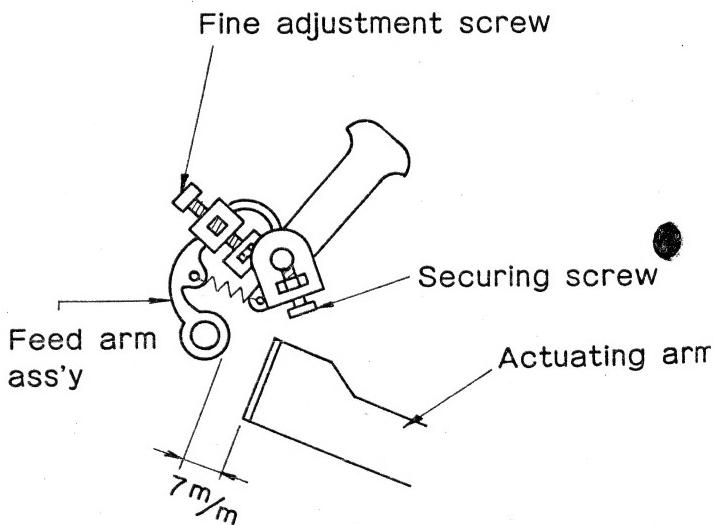

Fig. 1

6. TROUBLE SHOOTING

Symptom	Cause	Repair
When the tonearm is placed on a record face, the turntable does not rotate.	1. No current flows because of poor contact of the micro switch. 2. Lead wire disconnection.	1. Replace the old micro switch with a new one. 2. Check wiring continuity.
When the tonearm returns on the arm rest, the turntable does not stop its rotation. When the reject button is depressed, the tonearm does not return.	1. Too wide gap between the micro-switch and the feed arm. 2. Uncorrect wiring of the micro-switch. 1. No operation of the clutch plate and clutch guide. 2. Improper mesh between the main gear and the turntable spindle gear.	1. Adjust the gap to 0.3-0.6 mm. 2. Modify the wiring according to the wiring diagram. 1. Check the interlocking transmission mechanism of the reject button, and reject spring. 2. a. Check the gear gap. b. Check if the turntable spindle gear is positioned in the center of the notch of the main gear.
When the tonearm returns during playing a record.	1. Inclined record player with its left side down. 2. Deviated feed arm (The feed arm deviated toward the center of the turntable)	1. Place the record player horizontally. 2. Adjust the position of the feed arm properly.
When the stylus stays in the same groove.	1. Improper stylus force (Too light stylus force) 2. Caught tonearm lead wires. 3. Foreign matter between the clutch plate and the clutch guide.	1. Adjust stylus force. 2. Arrange the lead wires properly. 3. Remove the foreign matter.
When record playing is over, the tonearm does not return.	Deviated position of the feed arm (The feed arm deviates toward the direction opposite from the center of the turntable spindle)	Adjust the position of the feed arm.
When large impact sound is heard on the return of the tonearm.	1. Improper mesh between the turntable gear and the main gear. 2. Improper fly-out of the clutch plate or deformed engagement part of the clutch plate.	1. a. Check a gap between the turntable spindle gear and the main gear. b. Check if the clutch plate flies out until it strikes the side face of the turntable spindle gear. If not so, check and remove foreign matter between the clutch plate and the clutch guide or between the actuating arm and the mechanism base. b. Check the shape of the ejected part of the turntable spindle gear, (Figure 2).
When the tonearm returns, the stylus scratches a record face.	1. Excessively pitched up records. 2. Improperly adjusted stylus height.	1. Remove all record. Note: Place only one record on the turntable. 2. Adjust the stylus height.
When electrical output does not come out from the record player.	1. Improperly soldered tonearm lead wires to the 5P terminal strip. 2. Defective transmission path. 3. Defective cartridge.	1. Check the soldered parts concerned. 2. Check the continuity of the transmission path. 3. Replace the old cartridge with a new one.

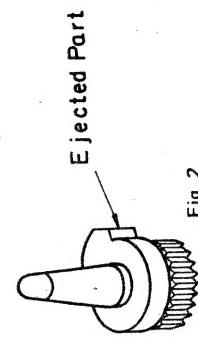

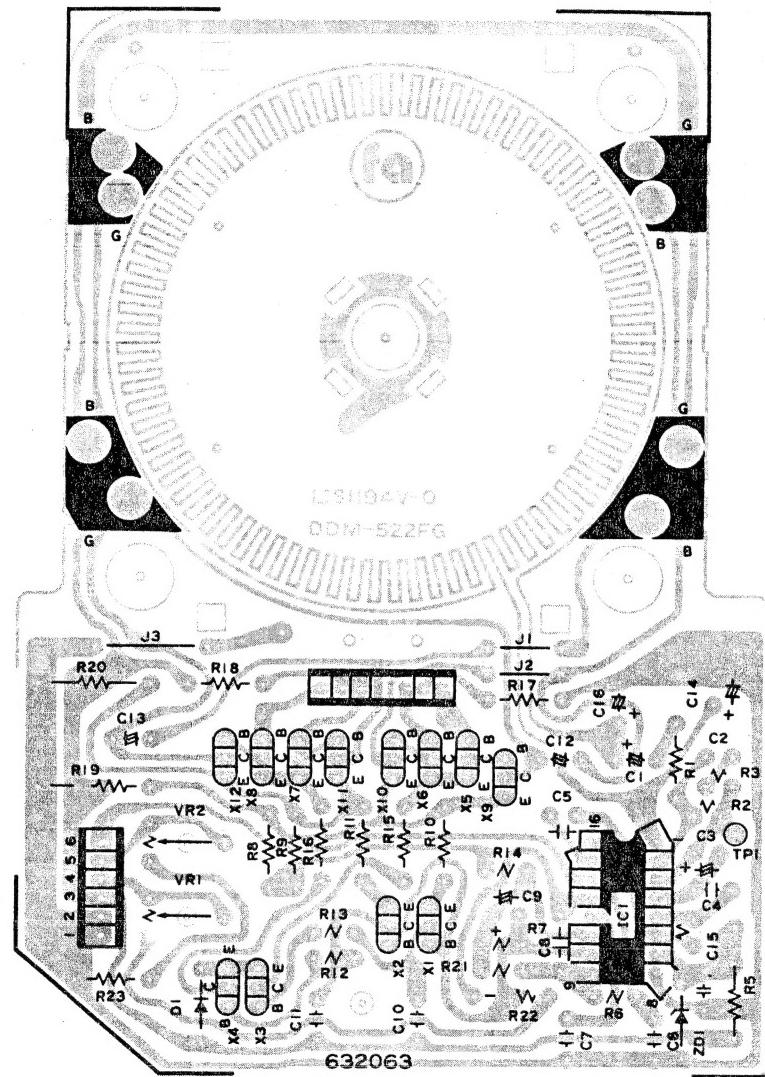

Fig. 2

Symptom	Cause	Procedure
When reproduced sound of one channel is distorted.	1. Too light stylus force. 2. Obliquely installed cartridge. 3. Too effective anti-skate.	1. Adjust the stylus force. 2. Adjust the installation of the cartridge. 3. Set the anti-skate to an adequate position.
When the stylus drops suddenly on the record face in cueing down.	1. Insufficient silicon oil. 2. Too heavy stylus force.	1. Supplement silicon oil (Use a product for 20,000 C/S (cm/stroke). 2. Adjust the stylus force.
Motor (continued)		a) Check as specified in item d) 2 Motor.
a) Motor Speed Change is non-existent.	a) Semi-fixed resistor (VR 1 or VR 2) or external Potentiometer is defective, or improper wiring. b) 1. Transformer or Rectifying circuit is defective.	b) 1. Check voltage between 3 and 2 of CNP 1 of Motor Control Circuit PCB. If 22V is not observed, replace Transformer or Rectifying circuit. 2. Check waveform of base signal of X5, X6, X7 and X8. Waveform should be
b) Direct Drive Motor does not rotate or speed is remarkably slow.		
		If not, Hall element is defective, replace Motor Control Circuit PCB.
		3. Check waveform of collector signal of X9, X10, X11, X12, X13, X14, X15, X16, X17, X18 is defective.
		
		If the waveform is not observed, check transistors X5, X6, X7, X8, X9, X10, X11 and X12, and replace defective one.
		c) 1. Check resistance of Motor Winding Wire. (between G and G, B and B) Infinite resistance: Break wire 0 resistance: Short wire 105 ohm (approx): Normal 2. Check voltage between terminals GND and 10 of IC1. If 0.6V is not observed, replace IC 1.
		d) 1. Check voltage between terminals GND and 7 of IC1. If 0.6V is not observed, replace IC 1. 2. Disconnects lead wires connected terminals 4 and 5 of CNP 1 of Motor Control Circuit PCB, then connect 4 and 5. If Motor Speed cannot be adjusted by VR1 or VR2, replace defective one. Then reconnect lead wires to terminals 4 and 5, if Motor speed can be adjusted by external Potentiometer. Replace Potentiometer, or check wiring of Speed Change Switch.
		2. IC 1 of Motor Control Circuit PCB is defective.
		d) 1. Zenor Diode (ZD 1) is defective.
		2. Semi-fixed resistor (VR 1 or VR 2) or external Potentiometer is defective, or improper wiring.
		d) Motor runs (Motor speed is remarkably high)

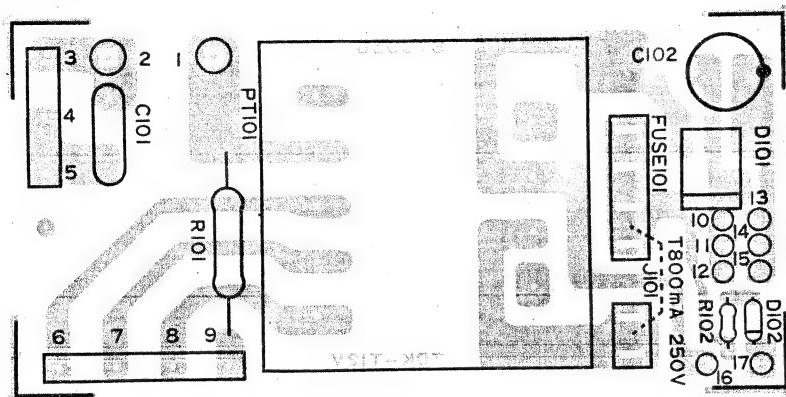

Symptom	Cause	Procedure
	<p>3. IC 1 is defective.</p> <p>4. FG pattern is defective, or IC 1 is defective.</p>	<p>3. Touch and release Direct Drive Motor Shaft by hand alternately while monitoring voltage between terminals GND and 10 of IC 1. If voltage does not fluctuate, replace IC 1.</p> <p>4. Check voltage between terminals GND and 3 of IC 1. Waveform should be</p> <p>If this waveform is not observed, FG pattern or IC 1 is defective, replace IC 1 or Direct Drive Motor Control circuit PCB.</p>
